

The Intelligent AI Onboarding Platform

Bridging the knowledge gap between new developers and unfamiliar codebases — automatically, accurately, and entirely local.

The Problem

No Codebase Clarity

New developers have no efficient way to understand an unfamiliar codebase, leaving them lost from day one.

No Structured Plan

There is no role-specific onboarding checklist or task plan — every new hire starts from scratch.

Senior Engineers Interrupted

Developers must repeatedly interrupt senior engineers with questions that the codebase itself could answer.

Invisible Progress

Onboarding progress is invisible to both the developer and the team lead — no one knows where anyone stands.

Hallucinated AI Answers

AI tools used without grounding in the actual codebase produce generic or hallucinated answers that cannot be trusted.

The Solution

One Platform. Zero Cloud. Total Accuracy.

The **Intelligent AI Onboarding and Developer Assistance Platform** is a locally-run Python and Streamlit application that addresses every gap in one place.

- Create a personal developer profile to get started instantly
- Automatically generate a **role-specific onboarding checklist**
- Point the app at your codebase — it indexes source files for natural-language Q&A
- Every answer is grounded in retrieved code snippets via **Retrieval-Augmented Generation (RAG)**
- Checklist progress tracked visually; all Q&A stored and browsable
- Low-confidence answers **auto-flagged** for human follow-up
- Runs with a single command — no cloud infrastructure required

Onboarding Dashboard

Your Onboarding at a Glance

The dashboard gives every new developer and team lead a unified view of onboarding status — no more guesswork about where someone stands.

- Visual progress indicators across all onboarding stages
- Role-specific task summaries front and center
- Quick access to Q&A history and flagged questions

Onboarding Checklist

Role-Specific. Automatically Generated.

Once a developer profile is created, the platform generates a structured checklist tailored to their role — so every new hire has a clear path forward from day one.

- Tasks organized by role and seniority level
- Progress tracked visually as items are completed
- Eliminates the need for manual onboarding document creation

Ask the Codebase

Natural Language Q&A, Grounded in Your Code

Developers ask questions in plain English — the platform retrieves relevant code snippets and generates accurate, project-specific answers using a **Retrieval-Augmented Generation (RAG)** pattern.

- No hallucinated or generic responses
- Every answer cites the actual source file
- Full Q&A history stored and browsable
- Low-confidence answers automatically flagged for human review

Knowledge Source & Developer Profile

Knowledge Source

Point the app at any local codebase folder — source files are indexed automatically to power accurate, grounded answers.

Developer Profile

Each developer creates a personal profile that drives role-specific checklist generation and personalizes the onboarding experience.

Flagged Questions

Human Oversight, Built In

When the AI cannot answer a question with sufficient confidence, it doesn't guess — it automatically flags the question for human follow-up, ensuring no developer is ever left with a misleading answer.

- Confidence threshold triggers automatic flagging
- Flagged questions surfaced to team leads for review
- Closes the loop between AI assistance and human expertise
- All data persists locally in JSON — no cloud required

□ The platform runs with a single command and requires zero cloud infrastructure — all data stays local.
